Training courses in TRIZ for universities

Target Invention offers training in two fields of knowledge:

- ★ Target Invention technologies (with TRIZ)
- ★ Laws of technical system evolution and their practical application

This knowledge is useful to specialists who deal with innovations: engineers, designers, innovation managers, etc. Training is offered both to students and to post-graduates.

Our participation can be as follows:

- Providing methodical materials on the course
- Organization of university teacher training
- Participation in student training (in the practical part of the training course)

Methodical materials

Training courses are offered in different forms:

- ★ E-learning
- ★ A “paper” textbook and methodical aid for a teacher
- ★ A series of training workshops conducted by Target Invention trainers

Training courses can be adapted to students' specialization: examples and training tasks are taken from a respective field.

For the time being, the training courses are available in English and in Russian. They can be translated into other languages if necessary.

E-learning can be conducted using the Target Invention LMS. Training materials can be adapted to the e-learning format of your university.

We are open to cooperation in publishing joint textbooks on targeted invention technologies and technical system evolution forecast.

Teacher training

Target Invention can organize preparation of teachers in the above-mentioned fields of knowledge. University teachers are trained in solving practical problems and explained the method details. The training goal is providing not only the knowledge of the theoretical material but also the ability to use the obtained knowledge in practice.

Participation in trainings for students and post-graduates

Post-graduate specialists expect practical use from trainings. The course effectiveness increases if training is based on solving the trainees' own production problems. The Target Invention specialists are experienced in executing invention projects and conducting courses based on solving real problems taken from the production practice of trainees.
